Circular Steel for Mass Market Applications

General Project overview

PRESENTER NAME: Jaume Pujante

EMAIL: jaume.pujante@eurecat.org

DATE: 2025/04/02

Circular Steel for Mass Market Applications

Introducing scrap-based Electric Arc Furnace steel for a greener circular economy in mass-market sheet metal goods

42 months duration
01/10/2024 to 30/04/2028

Grant agreement ID:
101177798

Budget: € 4.380.528
100% funded by the EU

Coordinated by
Eurecat, RTO

12 partners from
5 different European countries

Motivation and Objectives

Iron Ore
80-90 Mt/yr

Coking Coal
30-35 Mt/yr

CO₂ (BOF)
160 Mt/yr^a

CO₂ (EAF)
15 Mt/yr^a

BOF Steel: 86 Mt/yr^b

EAF Steel: 66Mt/yr^b

Iron Ore
150 Mt/yr^a

Coking Coal
41 Mt/yr

Ferrous Scrap
80 Mt/yr^a

Finished Steel
Netto: +13Mt/yr

Exp. 16Mt/yr^b

Imp. 29Mt/yr^b

Ferrous Scrap
Netto: -14Mt/yr

Imp. 5,5Mt/yr^b

Exp. 19.5Mt/yr^b

ULiège robotic sorting line

SENSOR-BASED SORTING SYSTEM
by MATVISION

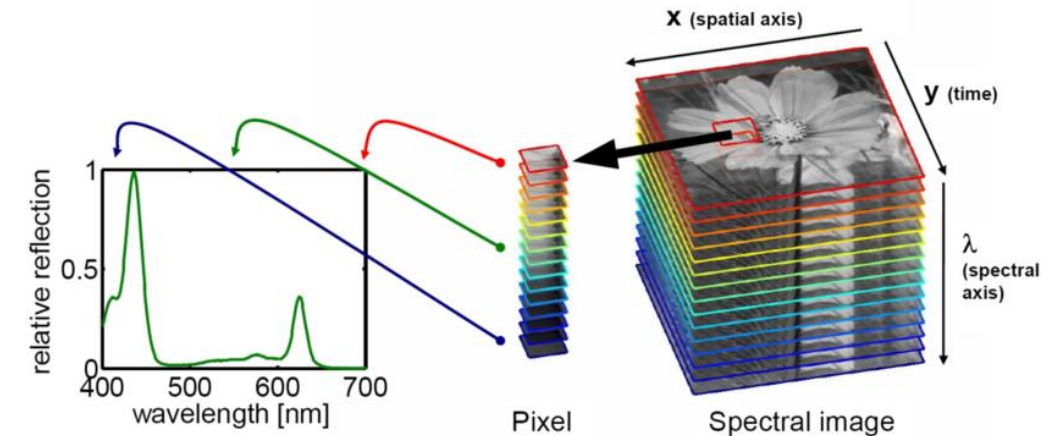

- Allows to assess which subset of sensors suit best a **specific case-study**
- Multi-output sorting with delta-robots => **Number of sorted classes is flexible**
- Up to 20 classes sorted in one pass

ULiège robotic sorting line

Differentiating your materials by

- **Shape:** 3D Camera to detect the pieces and measure their volume
- **Color:**
 - IRGB Camera
 - VNIR
 - SWIR (used for plastic differentiation)
- **Density**
 - Transmitted XRay to see through metals
 - TeraHertz (soon) to see through plastics
- **Elementary** for alloy differentiation and pollutant detection
 - LIBS to measure under painting layers and coatings
 - XRF (soon) for elementary measurements
- **Induction:** Induction sensors to differentiate metallic materials from plastics, wood, rubber,...

→ Customizable sensor combination adapted to your problem

PICKIT - MULTIPICK

PICKIT – MULTIPICK: first industrial line sorting 10 000 t/year of Zorba @ Comet Traitements in Obourg (Belgium)

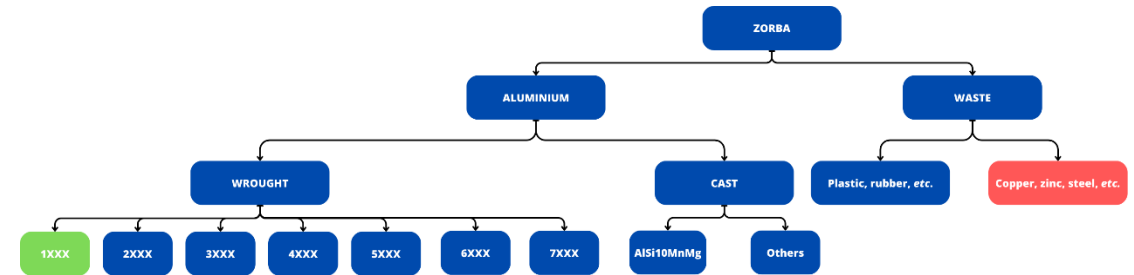

How to separate non-ferrous metals

How to separate **non-ferrous metals** (Cu, Al, Zn, brass,...) from shredded cars?

→ Multi sensor & multi output sorting demonstrator developed by an academia/industry consortium

Libs analysis:

- Sample surface is excited by a laser
- Plasma is created
- When cooling down, the plasma emits light
- This light contains peaks characteristic of elements present
- Optics collect light and transmit it to a spectrometer

Robotic sorting in the CISMA project

Robotic sorting in the Cisma project

The aim of work package is to:

- **Analyze and move beyond the current limitations of working with scrap as a raw material,**
- **Deal with undesired residues and alloying elements**

It translates into the following specific objectives:

- Analyze current fluxes of scrap (internal to the steelmakers and commercial/public market)
- Propose and test strategies to improve the quality of post-consumer scrap: using the robotic sorting line

Robotic sorting in the Cisma project

Common robotic sorting problems (e.g. Aluminium sorting)

- 60% of the stream could be considered as waste when targeting specific alloys (e.g. 5xxx, 6xxx)
- The target classes are removed from the belt during the sorting
- Quality is more important than the throughput

VS

Cisma robotic challenges

- Less than 2% of the stream could be considered as waste
- Negative sorting: The target classes stay on the belt
- High throughput is crucial
